## PANDEMIC PRESERVATION RULES FOR THE INACTIVATED COVID-19 VACCINE

- Plan adequately so that you can administer the inactive COVID-19 vaccine (CoronaVac) immediately after opening the vial.
- 1 dose is 0.5 ml.
- The vaccine is sensitive to daylight and needs to be duly protected from sunlight.
- It is sensitive to freezing. Care should be taken not to freeze the vaccine. The vial should be stored between +2 to +8°C.
- It can be stored on any shelf of the vaccine refrigerator cabinet. In no-frost refrigerators that do not have a vaccine refrigerator cabinet feature, they should preferably be stored on the second shelf from the top and close to the cover of the shelf so that they do not touch the inner wall of the cabinet and do not fall in front of the blowing channels. There should preferably be a freezing indicator in the refrigerator cabinet.
